

# Clean and Green

The detergent industry is having to contend with a changing market. The challenge facing formulators and manufacturers is to develop sustainable innovations which will help demonstrate that detergent ingredients present no risk to people or the environment.

Our latest product, Dissolvine® GL, is a green chelate. It combines excellent performance with a superior ecological profile. This readily biodegradable chelating agent offers a viable alternative to more traditional products.

In cleaning formulations and under harsh washing conditions, Dissolvine® GL complexes hard water ions very well while retaining its high performance at low and elevated temperatures, more than other chelating agents.

Dissolvine® GL shows excellent stain removing properties with tea, starch, meat and burnt milk stains.

The biocidal boosting power is better than currently used NTA or EDTA.
